Indigo Technologies Forms U.S. Affiliate

Indigo Technologies, a Brisbane, Australia-based company, has announced the formation of a U.S. affiliate, Indigo Technologies LLC. Bob Crynack has been named President of the new U.S. company, effective August 1, 2003. Bob will set up the new company in Pittsburgh, PA. Bob and William Armiger of EPSCO have been working with Indigo for the last two years in assessing the potential U.S. market and finding a site for a demonstration project for the Bi-Polar Agglomerator.

Indigo Technologies specializes in the development of new technologies and in bringing them to the marketplace. The Bi-Polar Agglomerator (see *Precip Newsletter*, January 2003) uses the electrostatic forces of oppositely-charged particles to combine the finer particles with the coarser ones. This reduces the fine particulate emissions and opacity. This technology is currently under full-scale testing under the project leadership of the Southern Company at Mississippi Power's Plant Watson on one-half of a 250-MW unit. Indigo has another full-scale installation at the Vales Point Power Station outside Sydney, Australia on one-fourth of a 660-MW unit.

Another technology under development is carbon separation. Using electrostatic forces, carbon is removed from Flyash. This technology has application to coal-fired units with high carbon content (LOI) in the ash and will have applicability for separation of activated carbon for mercury control.
